BACKGROUND

- Reading research is vast, encompassing diverse perspectives, from single letter recognition in the periphery to evaluating comprehension and fatigue in reading longer texts
- While our visual system operates similarly in various reading tasks, the specific underlying visual mechanisms for each task may differ.
- To gain a complete understanding of the factors affecting reading, it is crucial to assess and compare their impact across different tasks.

Aim:

 Investigating the impact of typefaces in relation to different modes of reading

Questions:

- Do different fonts behave similarly across different reading tasks?
- Are the best/worst performing fonts consistent across different reading tasks?

- The best performing typeface showed correlations across reading tasks:
- High correlation between glance and sentence reading (r = .52, p < .001),
- Differences were also observed
 - Merriweather is the optimal font for interlude and glance reading,
- Source Serif Pro shows the best performance in sentence reading

¹University of Central Florida; ²The Readability Consortium; ³Typography for Good **Corresponding Author: nilsu.atilgan@ucf.edu**

RESULTS

• Moderate correlations between glance and interlude tasks (r = .44, p < .001), as well as sentence and interlude tasks (r = .36, p < .001)</p>

Word or Pseudo Word (variable timing) Mask 2 200ms Response < 5000ms Was that a word? Modelled after Dobres et al., 2016, Ergonomics.

CONCLUSIONS

- The optimum typeface, associated with the best performance, showed correlations across reading modes, **suggesting shared** underlying mechanisms
- Observed differences in the optimum typeface across different tasks, possibly indicating **adaptive** strategies in the visual system based on the task at hand
